Vrinda Store Retail Analysis

Executive summary | 2022 historical data | Guided Excel portfolio project

Purpose

Assess recorded retail activity by channel, customer group and status to support merchandising and operational review. The results describe the workbook entries and provide priorities for further testing.

Records	Distinct Order IDs	Recorded amount INR
31,047	28,471	21,176,377

Method and scope

Used Excel PivotTables, charts and slicers, with a separate Validation sheet. The channel measure now sums Amount, numeric age bands replace ambiguous labels, and record counts are distinct from unique IDs. Status totals reconcile to 31,047 records and INR 21,176,377. Date values and month labels agree within 2022.

Key findings

Channel concentration: Amazon contributes 35.51% of recorded amount. Amazon, Myntra and Flipkart together contribute 80.44%.

Customer and timing patterns: Women account for 64.05% of recorded amount. March has the highest monthly amount at INR 1,928,066, with 2,819 records.

Status scope: Delivered records account for INR 19,710,544. Cancelled, returned and refunded records account for INR 1,465,833 combined. These values are not a measure of financial loss or confirmed net revenue.

Proposed actions

The retail manager should review merchandising on the largest channels and obtain cost and margin data before reallocating spend. Operations should investigate non-delivered activity using reason codes. The data owner should standardise state names and confirm the meaning of repeated Order IDs.

Interpretation limits

Repeated IDs may represent product lines, repeated totals or other records; their meaning remains unresolved. Geographic labels include variants such as DELHI and New Delhi. All amount measures retain the source records and specified statuses. One historical year cannot establish recurring seasonality, causal uplift or current performance. No profit, ROI or realised savings are claimed.
